

GLX-PCB-PRO

Main Printed Circuit Board (PCB) for Pro Logic™

This replacement assembly may support additional features than the board it replaces. For detailed information, download your model's manual* from the web at <http://www.hayward-pool.com>.

*P4 models: Pro Logic Installation manual (Oct 08 or later)

*P4 models: Pro Logic Operation manual (Oct 08 or later)

*PS models: Pro Logic Installation manual (Oct 08 or later)

*PS models: Pro Logic Operation manual (Oct 08 or later)

Compatibility

This circuit board is compatible with all Pro Logic "P-4", "PS-4", "PS-8" and "PS-16" units. The microprocessor software will automatically check the type of local display that is connected and adjust the Pro Logic features and operation to match the appropriate model type.

If no local display is connected, or if there is a problem with the local display and it does not respond to inquiries from the main PCB, then the main PCB will assume that the system is a Pro Logic P-4 model. If this occurs: First fix the problem (install or fix the local display) and then cycle power off and back on. The Pro Logic will recheck the local display and operate accordingly.

Circuit Board Replacement

1. **Record the System Settings:** The Configuration, Timers, and Settings menus contain all of the information regarding how the Pro Logic is programmed to operate a specific pool system. This information is stored on the main PCB and it is very important that all of this information gets transferred from the old PCB to the new PCB. Record all programming information (Configuration menu, Timers menu, and Settings menu) before attempting to replace the board.
2. **Remove the old board:** Make sure that ALL circuit breakers are OFF prior to PCB removal.
 - a. Remove metal panel to expose the local display and circuit board.
 - b. Remove the local display by pulling up and unplugging cable.
 - c. Unplug the sensor and display communication terminal blocks from the old PCB - you don't need to disconnect/reconnect individual wires.
 - d. Remove transformer wires and any other wires that are connected to the old board, making note of their locations.
 - e. Remove the board by loosening the 2 mounting screws and sliding the board forward. When the board comes loose from the enclosure, pull it up and out.
3. **Install the new GLX-PCB-PRO circuit board:**
 - a. Install the new board using the two mounting screws.
 - b. The locations of the transformer lugs may be different from the old board. Refer to the wiring diagram on the back page of this sheet for transformer wiring information.
 - c. Connect the remaining wires including the sensor and display communication terminal blocks onto the new circuit board. If there are any questions about wiring locations, refer to the Installation manual found on the web.
 - d. Plug in and install the local display so that the new PCB can properly determine the system model type (P-4, PS-4, PS-8, PS-16).
4. **Turn power on and reset Configuration to Default:**
 - a. Turn power back on to the Pro Logic and confirm that the board is working properly.
 - b. Reset all of the Configuration parameters to their Default values using the following instructions:

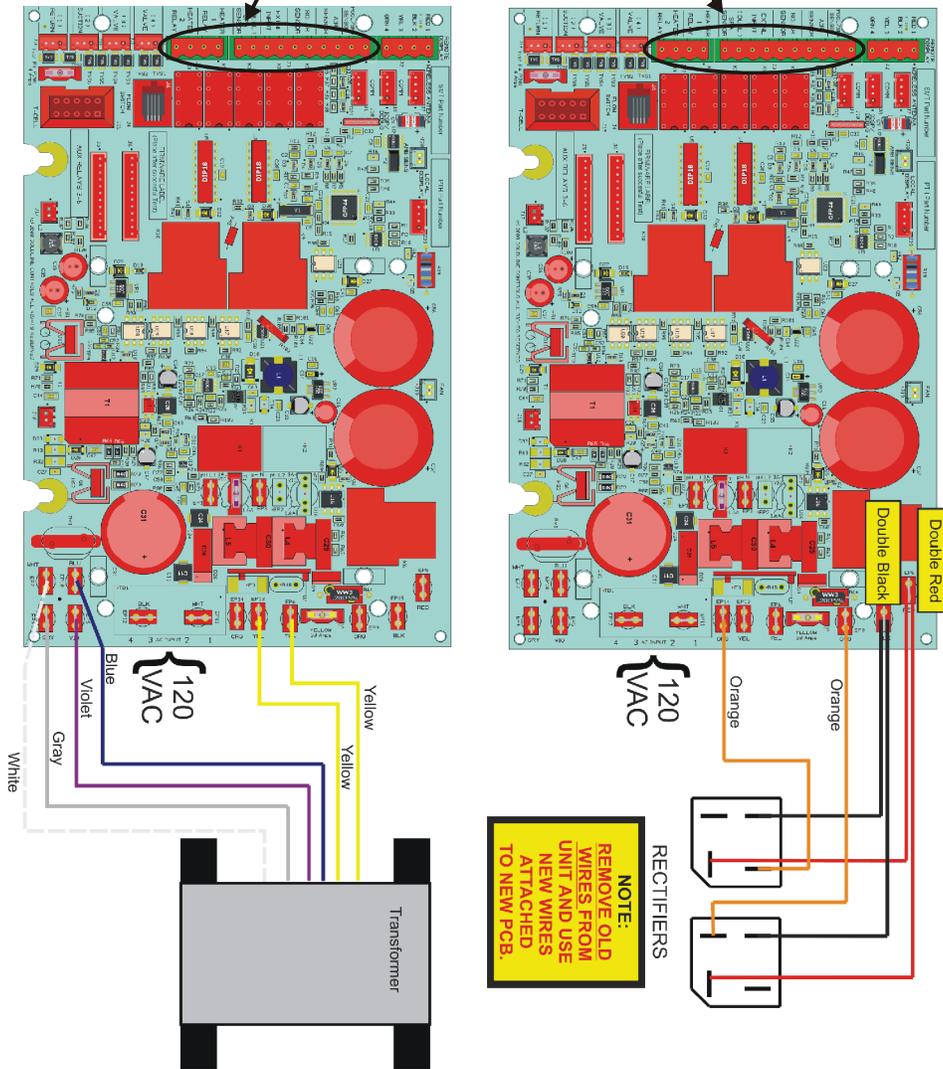

Configur at ion Menu-Locked		Press repeatedly until "Configuration Menu" is displayed
		Press BOTH buttons SIMULTANEOUSLY for 5 seconds to unlock
Configur at ion Menu-Unlocked		Press left arrow button
Reset Config. to Default Press +		Initiate reset of all configuration parameters
		Move to previous/next configuration menu (config. not reset)
Are you sure? + to proceed		Reset all configuration parameters
		Move to previous/next menu (config. not reset)
Config. reset Confirmed		Move to previous/next configuration menu

- c. Enter the prior programming information using the Configuration, Timers and Settings menus.

HAYWARD®

NOTE: This board may contain more inputs than the board it replaces. Do not re-use old connectors and be sure to make proper wiring connections.
